ABSTRACT

A display of CPU utilization in a multiprocessor system is provided. This feature illustrates processor utilization and application group assignments to CPUs and clusters of CPUs. Various graphic indicator are described that can be used to display processor utilization and indicate processors that have no application group assignments. For example, bar graphs as well as gauge displays can be used to visually convey processor utilization. As a result, a user can visually determine the processor utilization and application group assignments across a multiprocessor system. Additionally, various colors and shadings can be used to visually convey application group assignments.
